

QA Audit Report

OrangeHRM Demo

Independent Manual QA Demonstration Project

Application	OrangeHRM Demo
Application Type	Web Application
Testing Type	Independent Manual QA Audit
Environment	Google Chrome / Windows / Public Demo
Test Cases Executed	24
Execution Result	23 PASS / 0 FAIL / 1 BLOCKED
Confirmed Defects	0

Prepared by: Radjibou IBRAHIM — Junior QA Manual Tester

1. Executive Summary

This report summarizes an independent manual QA audit performed on the public OrangeHRM Demo environment. The audit focused on selected authentication, navigation and employee-management workflows. A total of 24 test cases were executed: 23 passed, none failed, and one was blocked.

No confirmed functional defects were identified during the audit. The single blocked test case could not be conclusively assessed because the public demo environment may not guarantee data persistence between sessions.

2. Application Under Test

Application: OrangeHRM Demo

URL: <https://opensource-demo.orangehrmlive.com/web/index.php/auth/login>

The application was used solely as a public demonstration target for this personal QA portfolio project.

3. Audit Objective

- Validate selected critical user workflows.
- Verify positive and negative functional scenarios.
- Explore selected edge cases and basic UI/UX behavior.
- Document reproducible findings with appropriate evidence.
- Demonstrate a structured manual QA workflow.

4. Scope

In Scope

- Login with valid, invalid and empty credentials
- Logout
- Dashboard and main navigation
- PIM / Employee List
- Employee search
- Add Employee form
- Required-field validation
- Employee creation and retrieval
- Exploratory edge cases and basic UI/UX checks

Out of Scope

- API testing
- SQL/database testing
- Performance/load testing
- Security penetration testing

- Mobile testing
- Full regression of every OrangeHRM module

5. Testing Approach

The audit combined structured manual testing with exploratory investigation. The approach included functional, positive, negative, exploratory, usability/UI and edge-case testing.

6. Test Environment

Item	Environment
Application	OrangeHRM Demo
Browser	Google Chrome
Operating System	Windows
Testing Type	Manual
Environment	Public Demo

7. Test Execution Summary

Status	Count	Percentage
PASS	23	95.83%
FAIL	0	0.00%
BLOCKED	1	4.17%
Total	24	100.00%

Pass rate is calculated as passed test cases divided by total executed test cases: $23 / 24 = 95.83\%$.

8. Blocked Test Case

Test Case: TC-018 **Evidence:** EVD-018 **Status:** BLOCKED

Result cannot be confirmed as a functional defect because the public demo environment may not guarantee data persistence between sessions.

The test should be repeated immediately after TC-017 within the same active session or executed in a persistent test environment.

No defect was created from TC-018 because the observed result could not be reliably attributed to a functional defect in the application.

9. Defect Assessment

Confirmed functional defects: 0

No issue met the project's evidence and reproducibility criteria for defect reporting. The absence of reported defects is intentional and reflects the actual test results.

10. Evidence & Traceability

Each test case is associated with a standardized Evidence ID from EVD-001 through EVD-024. These identifiers are the same references used in the test execution documentation.

Example: TC-018 → EVD-018. This provides direct traceability between the test case and its evidence reference.

11. Key Findings

- 23 of 24 executed test cases passed.
- No test case was classified as FAIL.
- One test case was blocked because of a limitation related to the public demo environment.
- No confirmed functional defect was reported.
- The audit results apply only to the defined scope and tested environment.

12. Limitations

- The application was tested through a public demonstration environment.
- The audit covered selected workflows rather than the entire OrangeHRM platform.
- API, database, performance, security penetration and mobile testing were outside scope.
- The public environment may behave differently from a persistent production or staging environment.

13. Conclusion

Within the defined scope and test environment, the audit achieved a 95.83% pass rate, with 23 passed test cases and one blocked case. No confirmed functional defects were identified.

The blocked case should be repeated in a persistent environment or within the same active session as the preceding test when reliable data persistence is required.

The results should not be interpreted as a guarantee that the application is defect-free outside the tested scope.

14. Disclaimer

This is an independent personal QA demonstration project. It is not affiliated with, sponsored by, commissioned by, or endorsed by OrangeHRM. The OrangeHRM Demo application is used solely for testing practice and portfolio demonstration.
